

DATA HANDLING

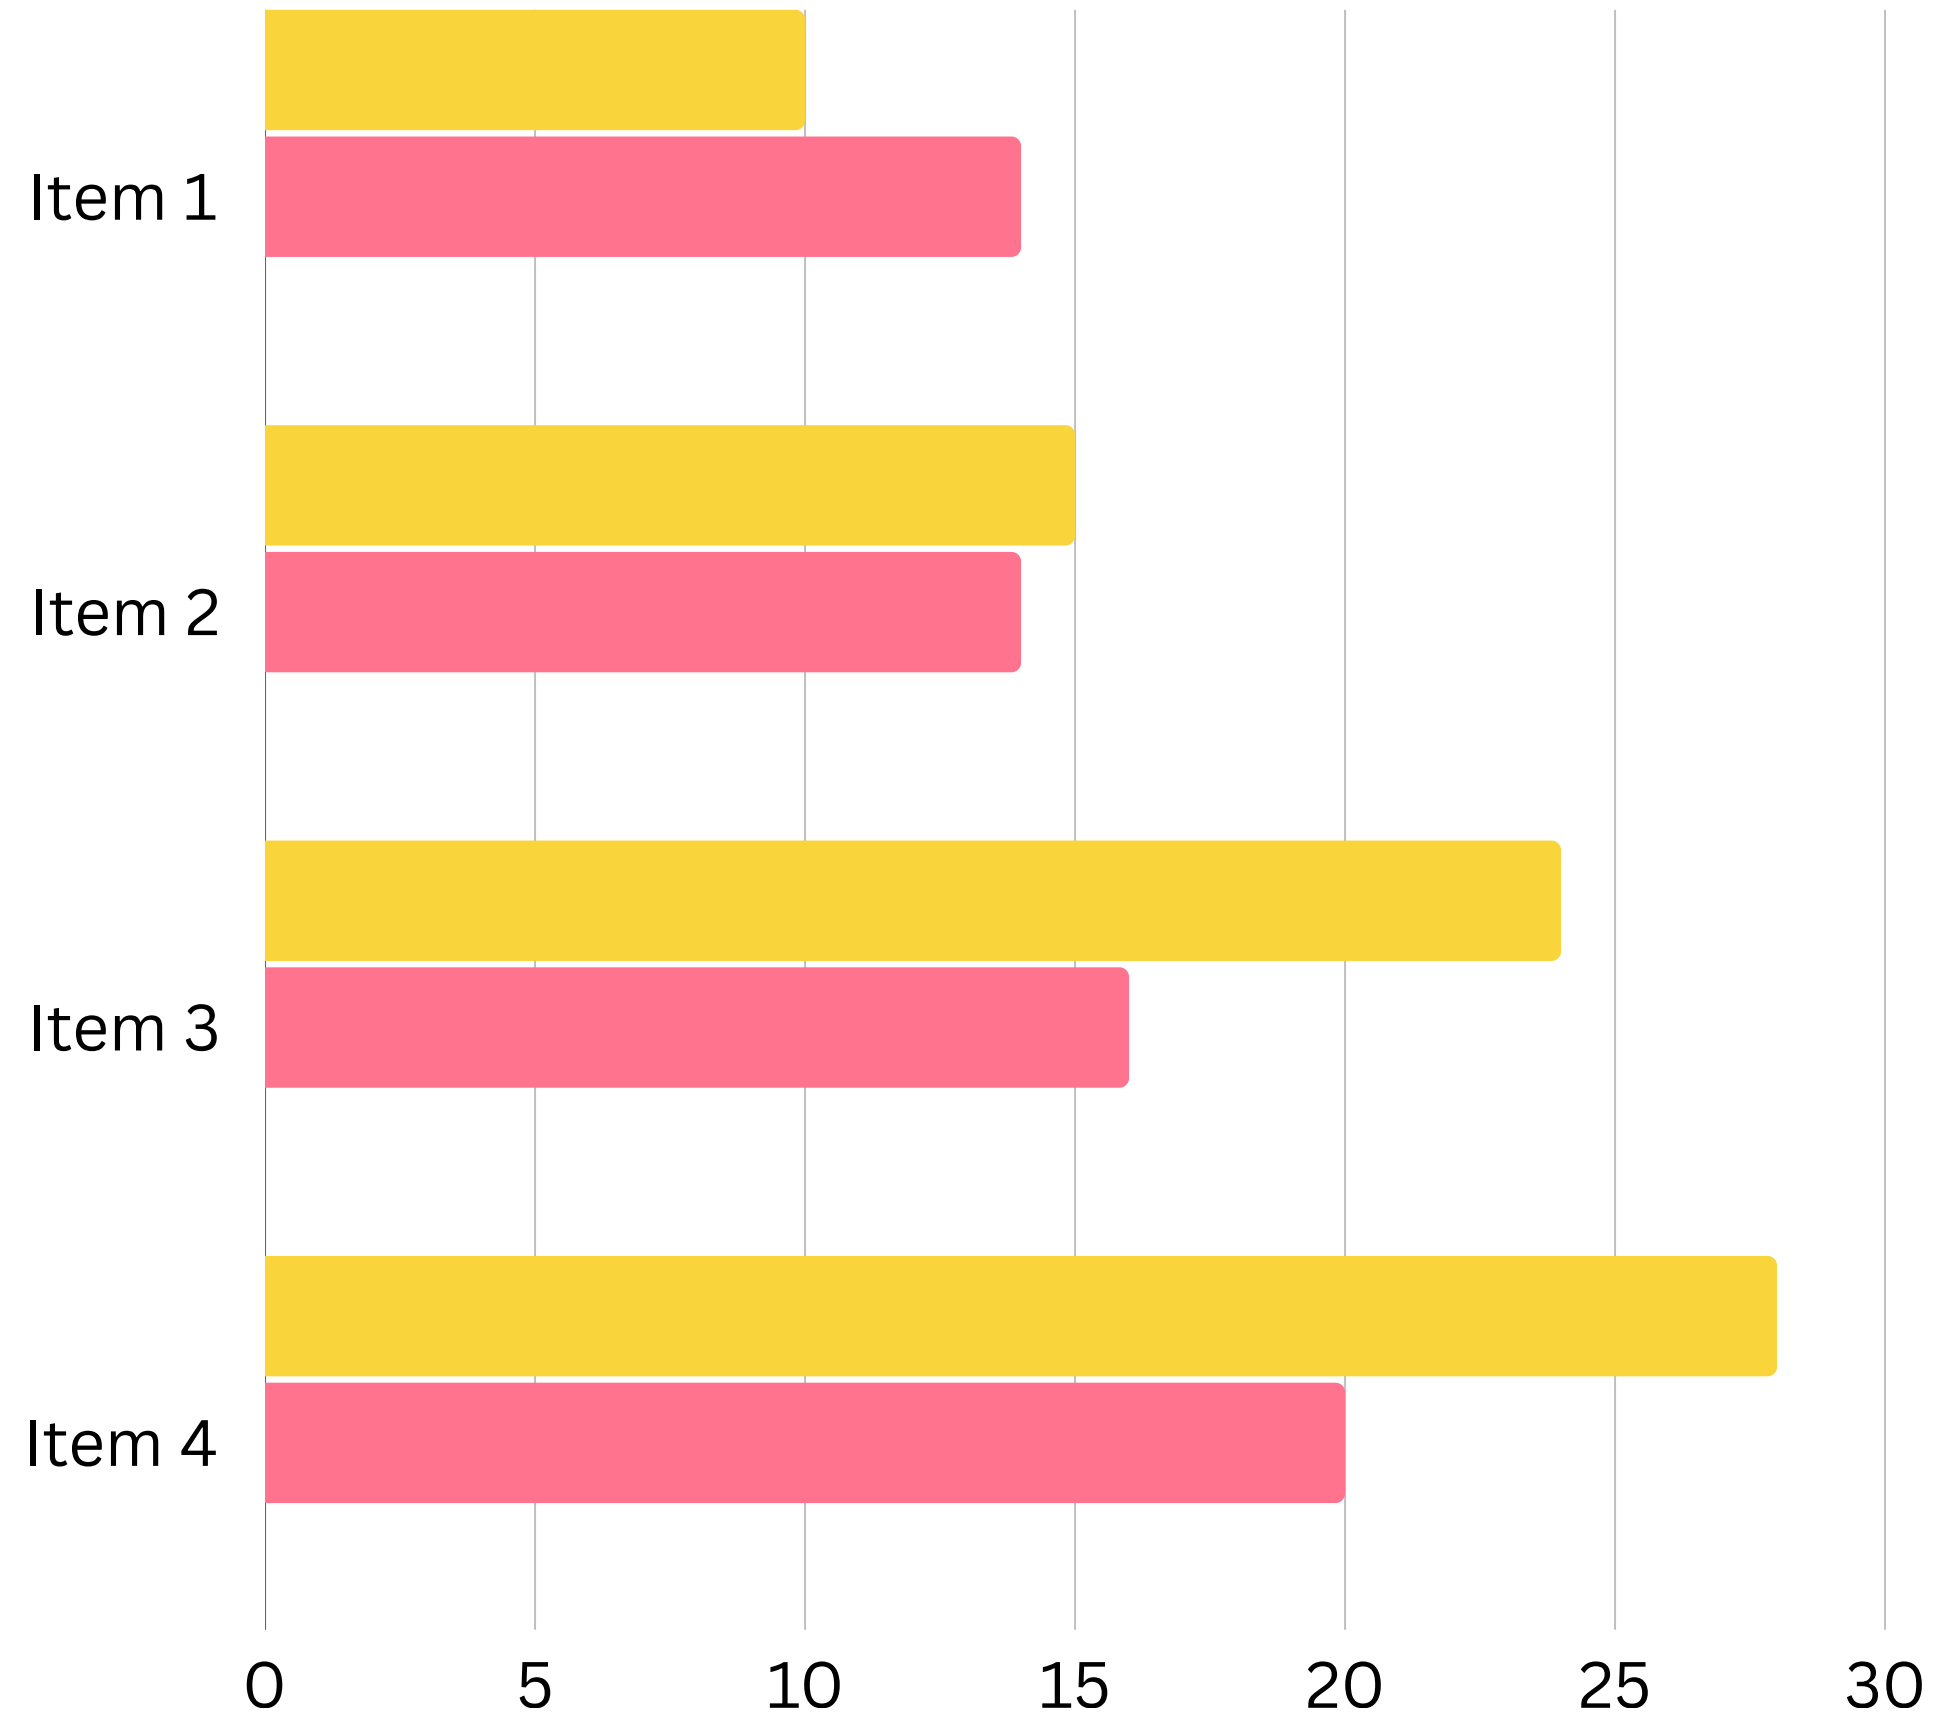

Grade 4

DATA

Data is information we collect, like numbers, facts, or details. It helps us learn and make decisions. Data can be shown in different ways, like charts, graphs, or tables. Data representation helps people understand the information quickly and easily.

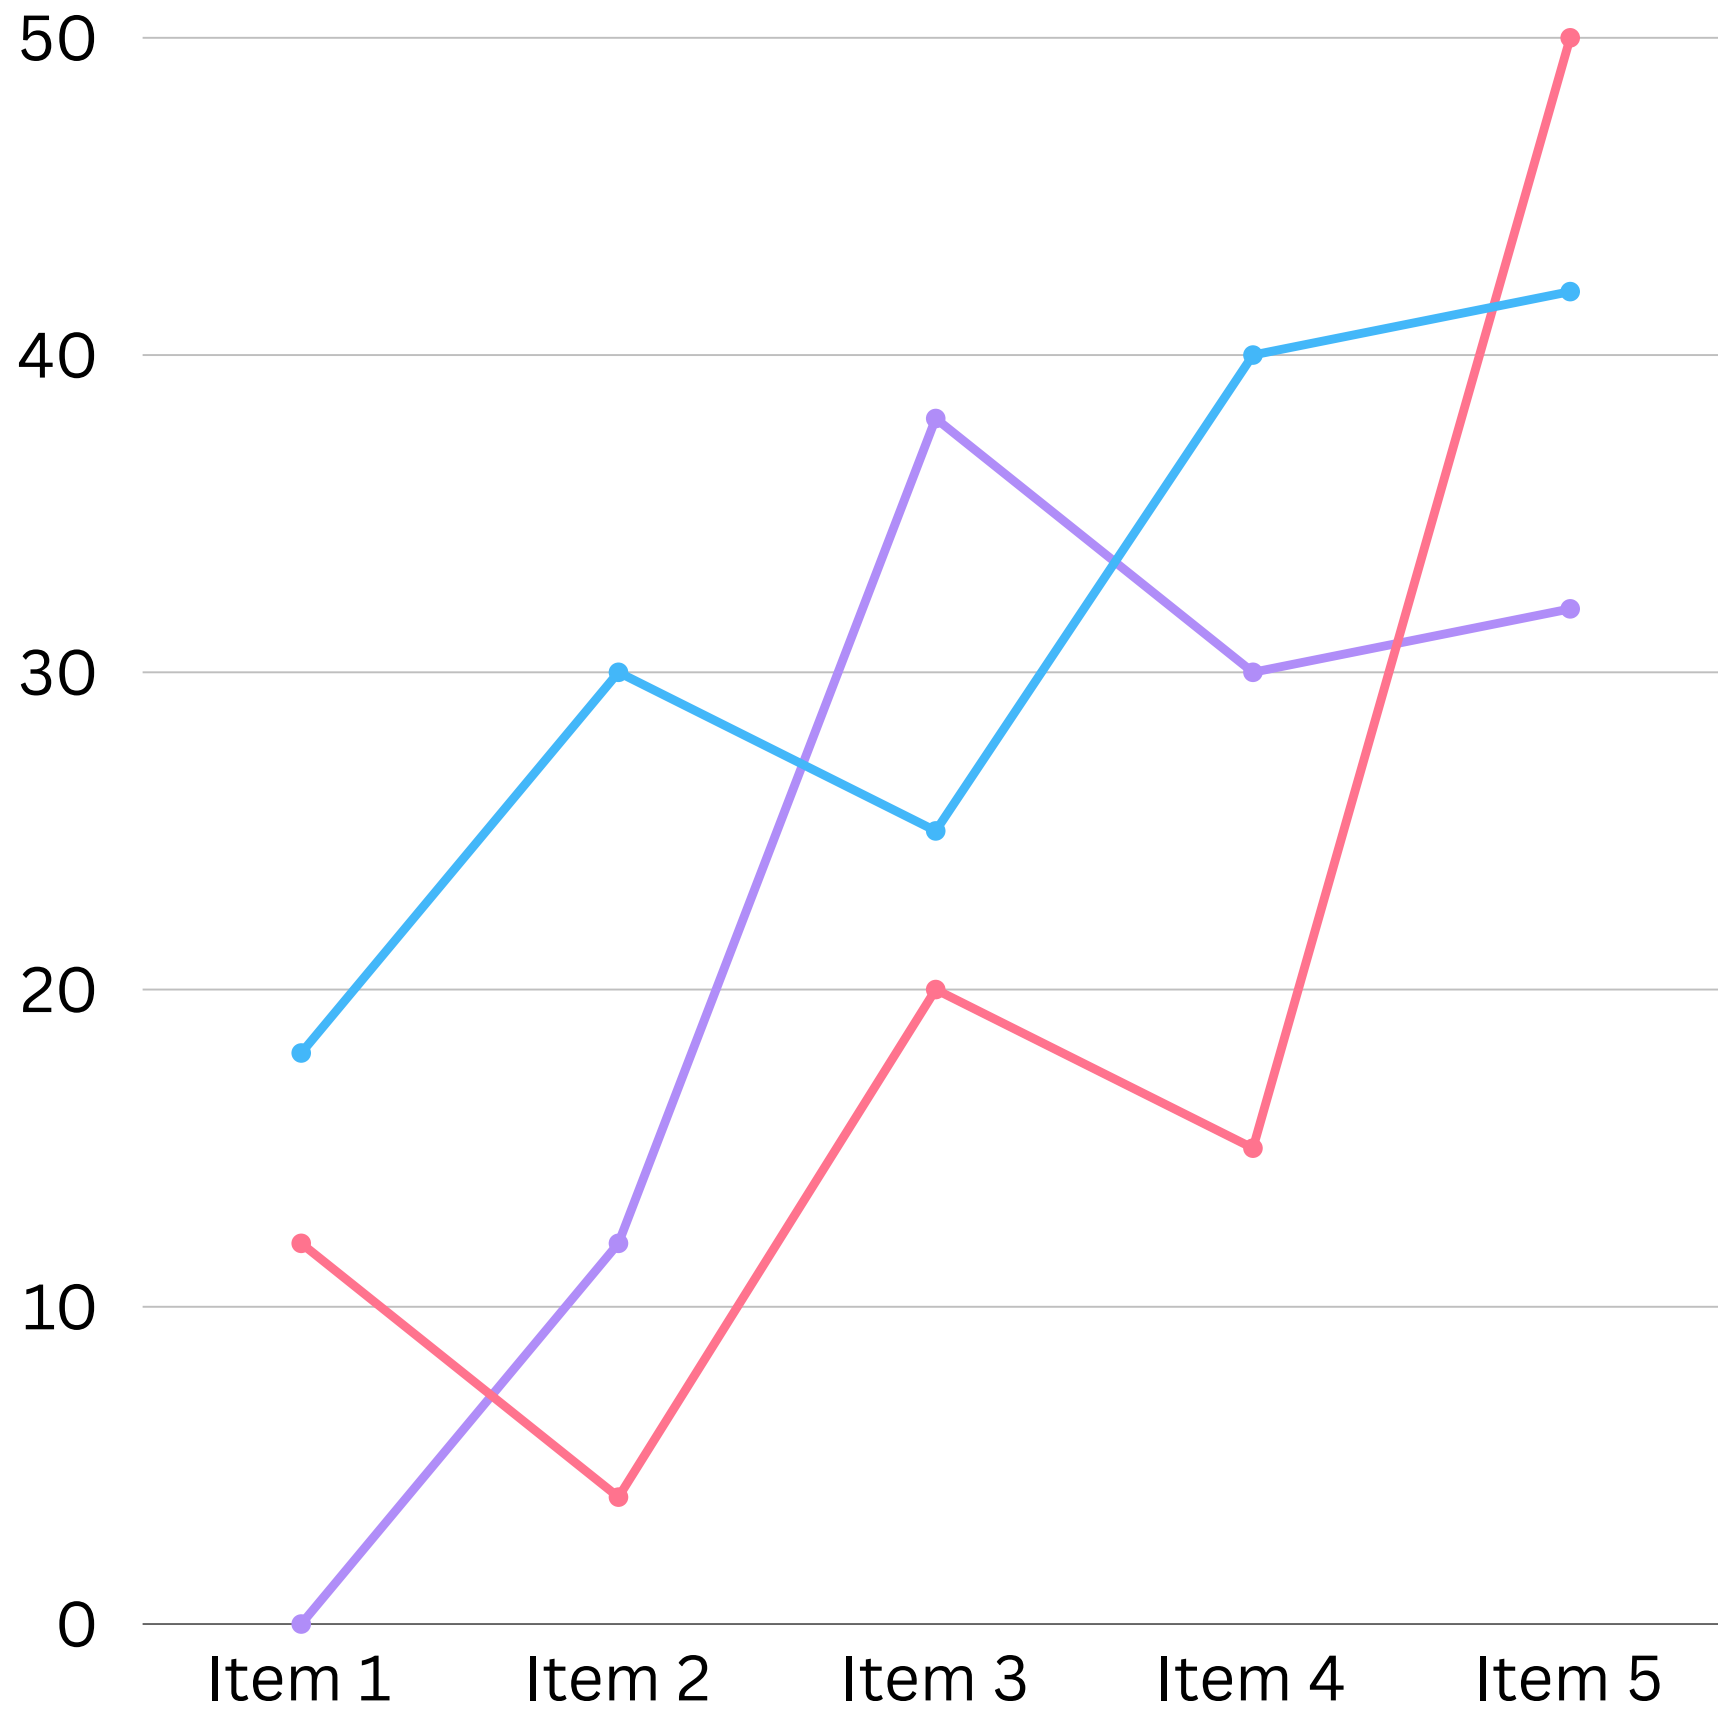

A bar chart is a way to show information using bars. Each bar represents something, like how many people like different ice cream flavours.

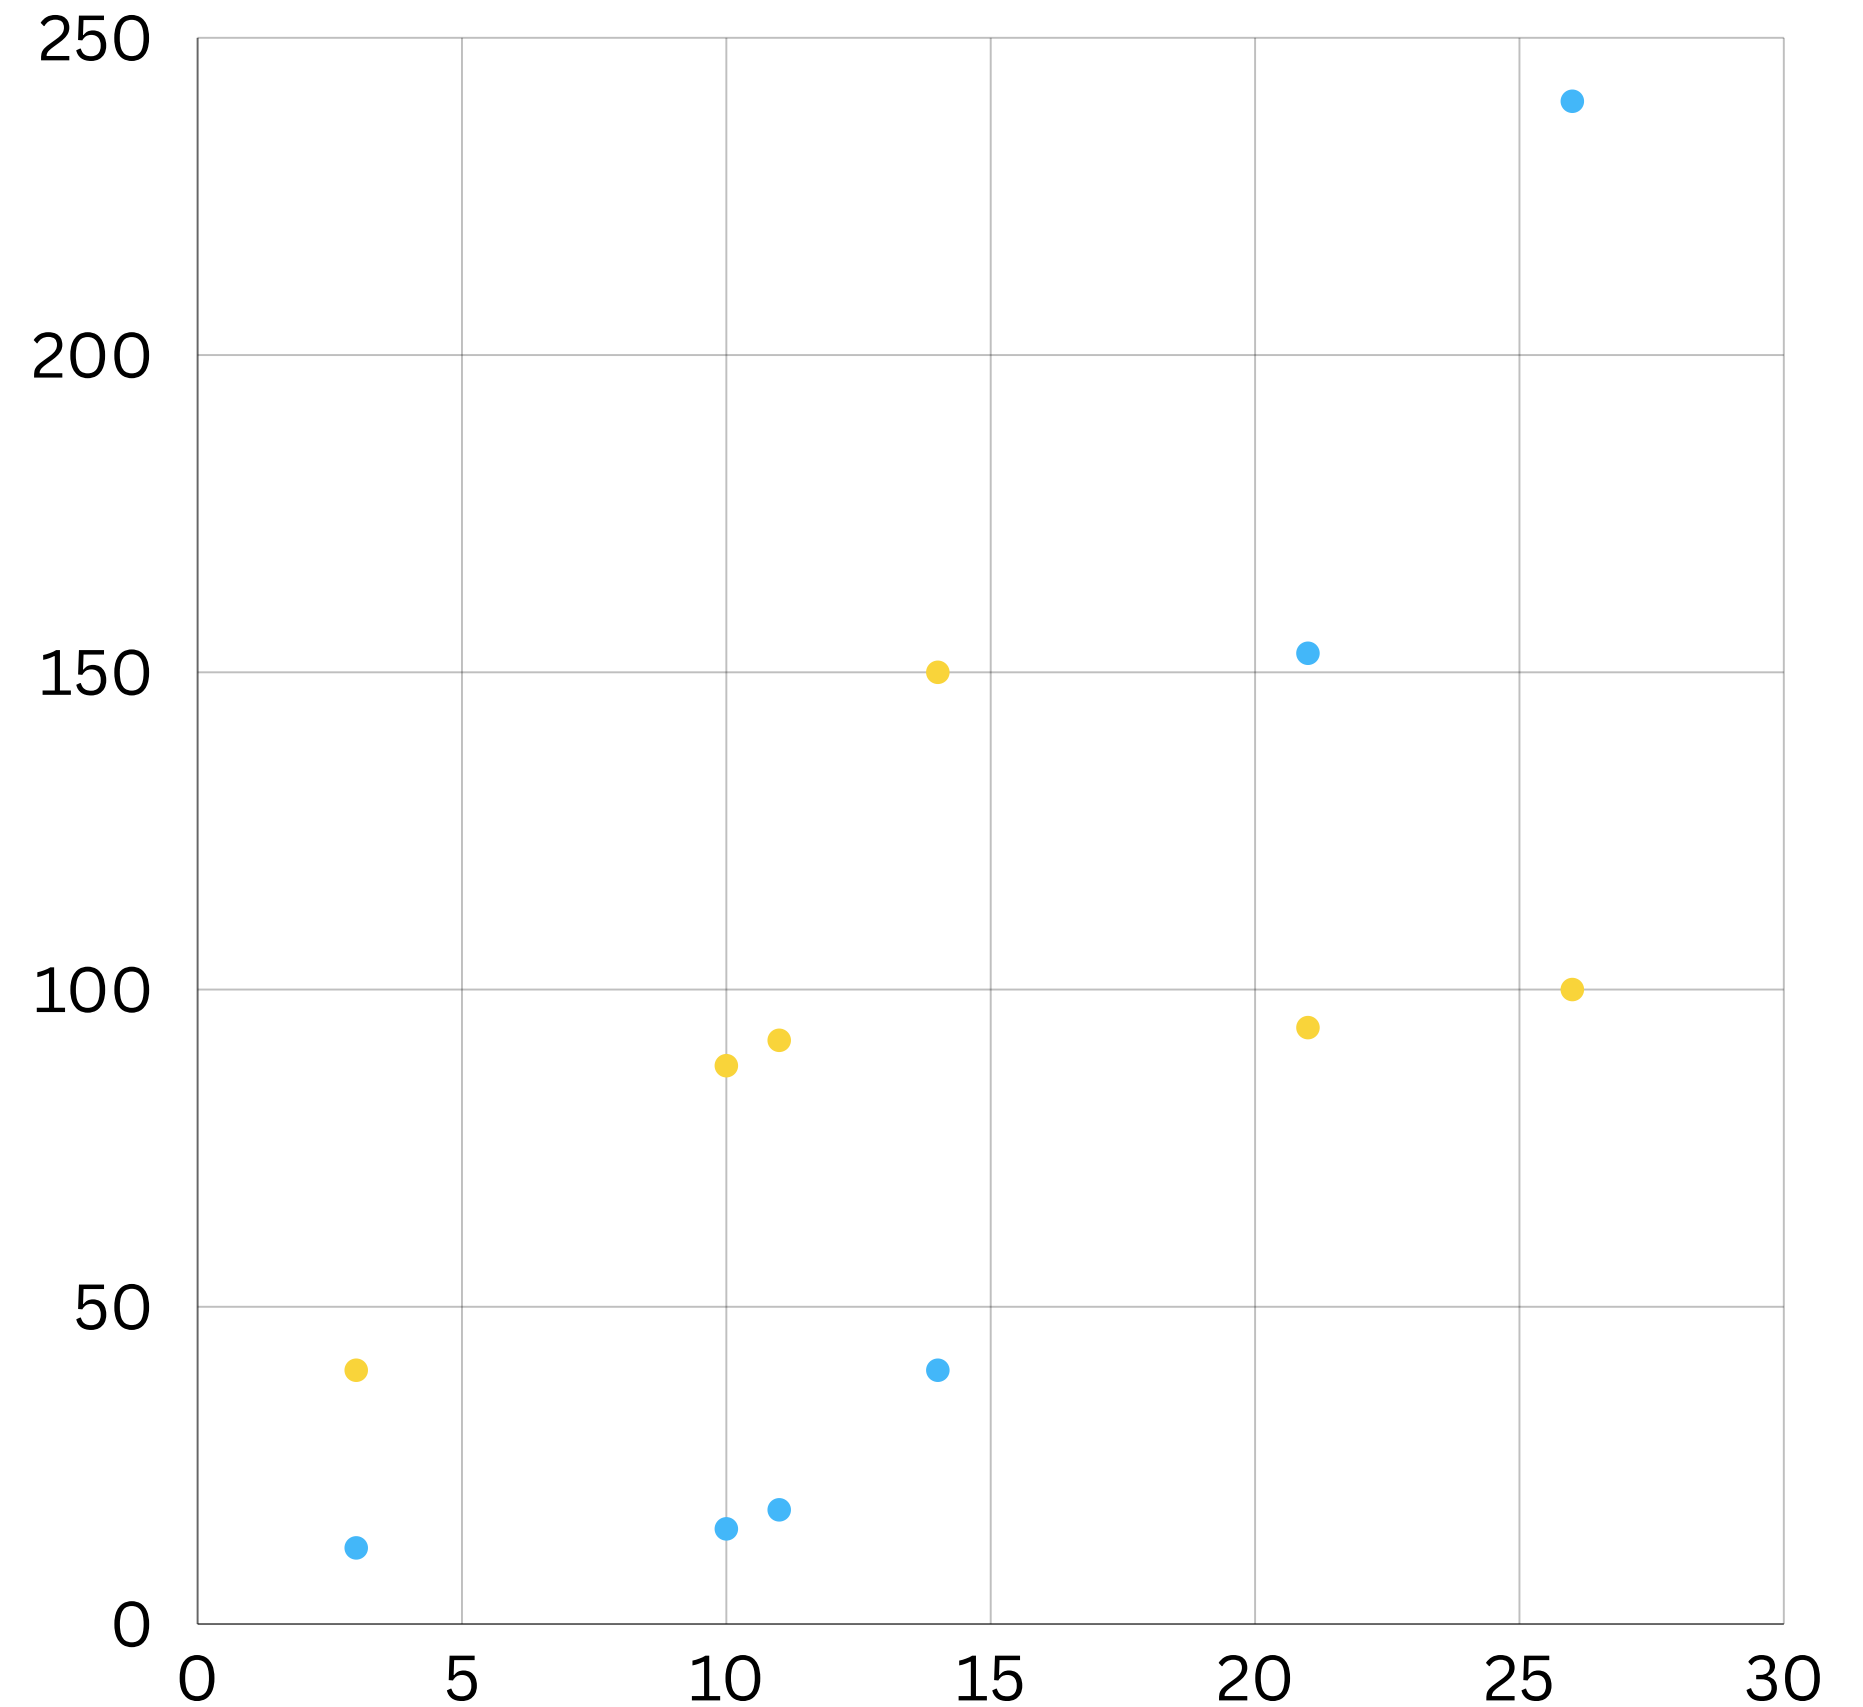

Bar charts can be constructed vertically and horizontally.

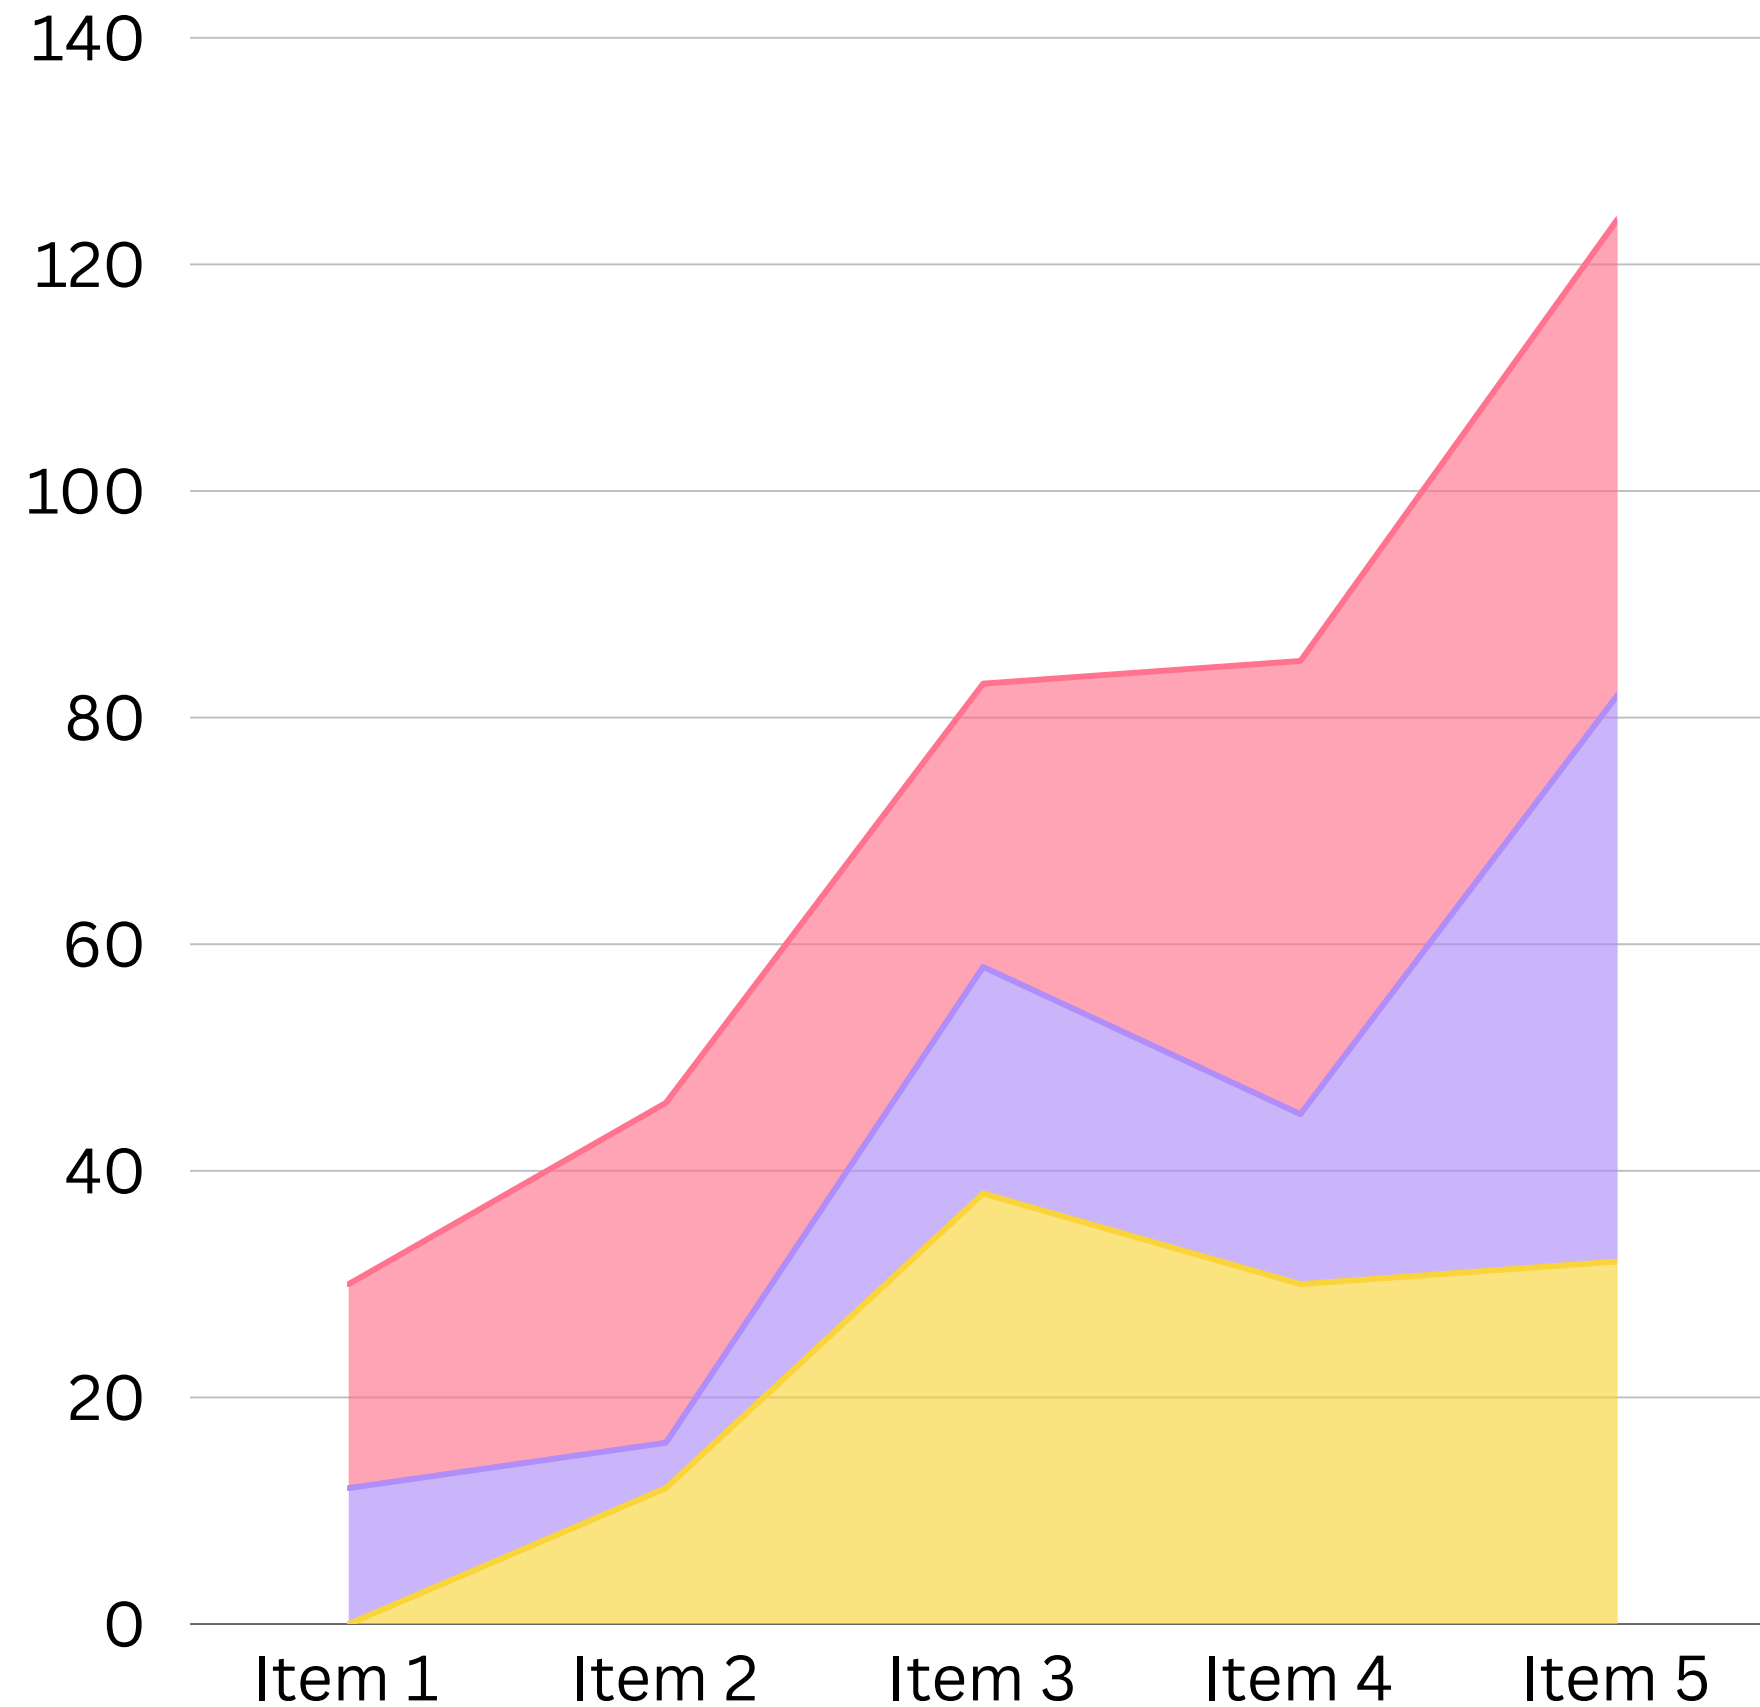

Bar charts help us see and compare information easily.

A line chart is like connecting the dots with lines. Each dot shows a number or how something changes over time. It helps us see trends or changes in data.

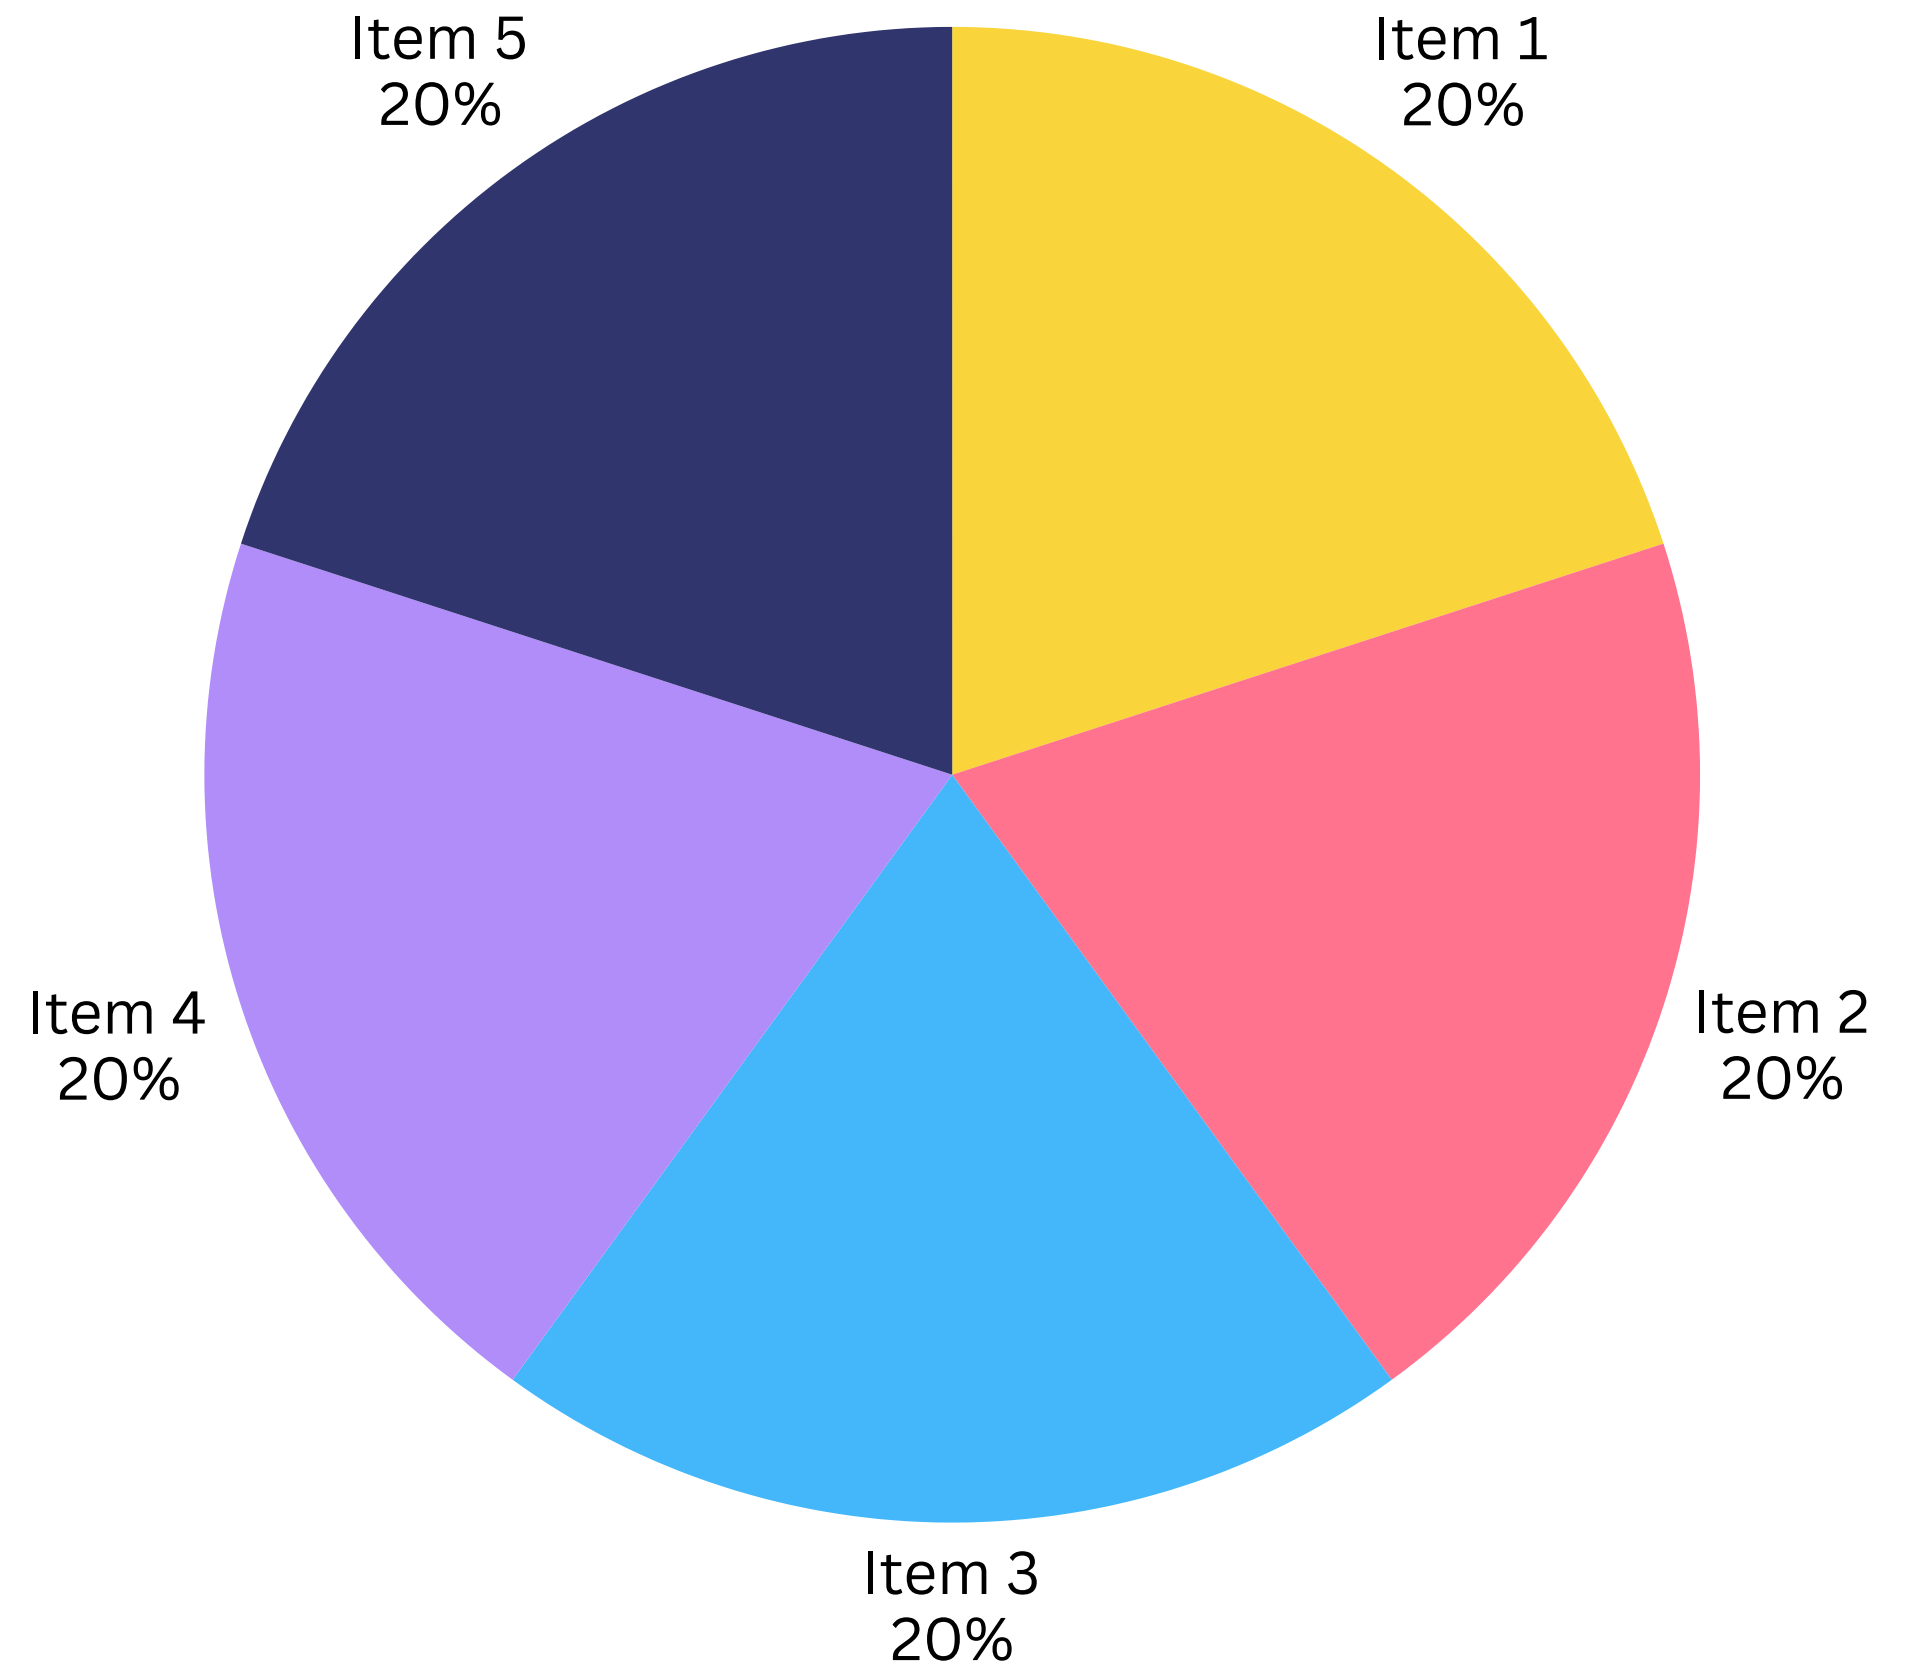

A scatterplot chart is like a collection of dots on a graph. Each dot represents something. We use it when we want to see if two things are related. Scatterplots help us see if there's a connection between two things by looking at how the dots are spread out.

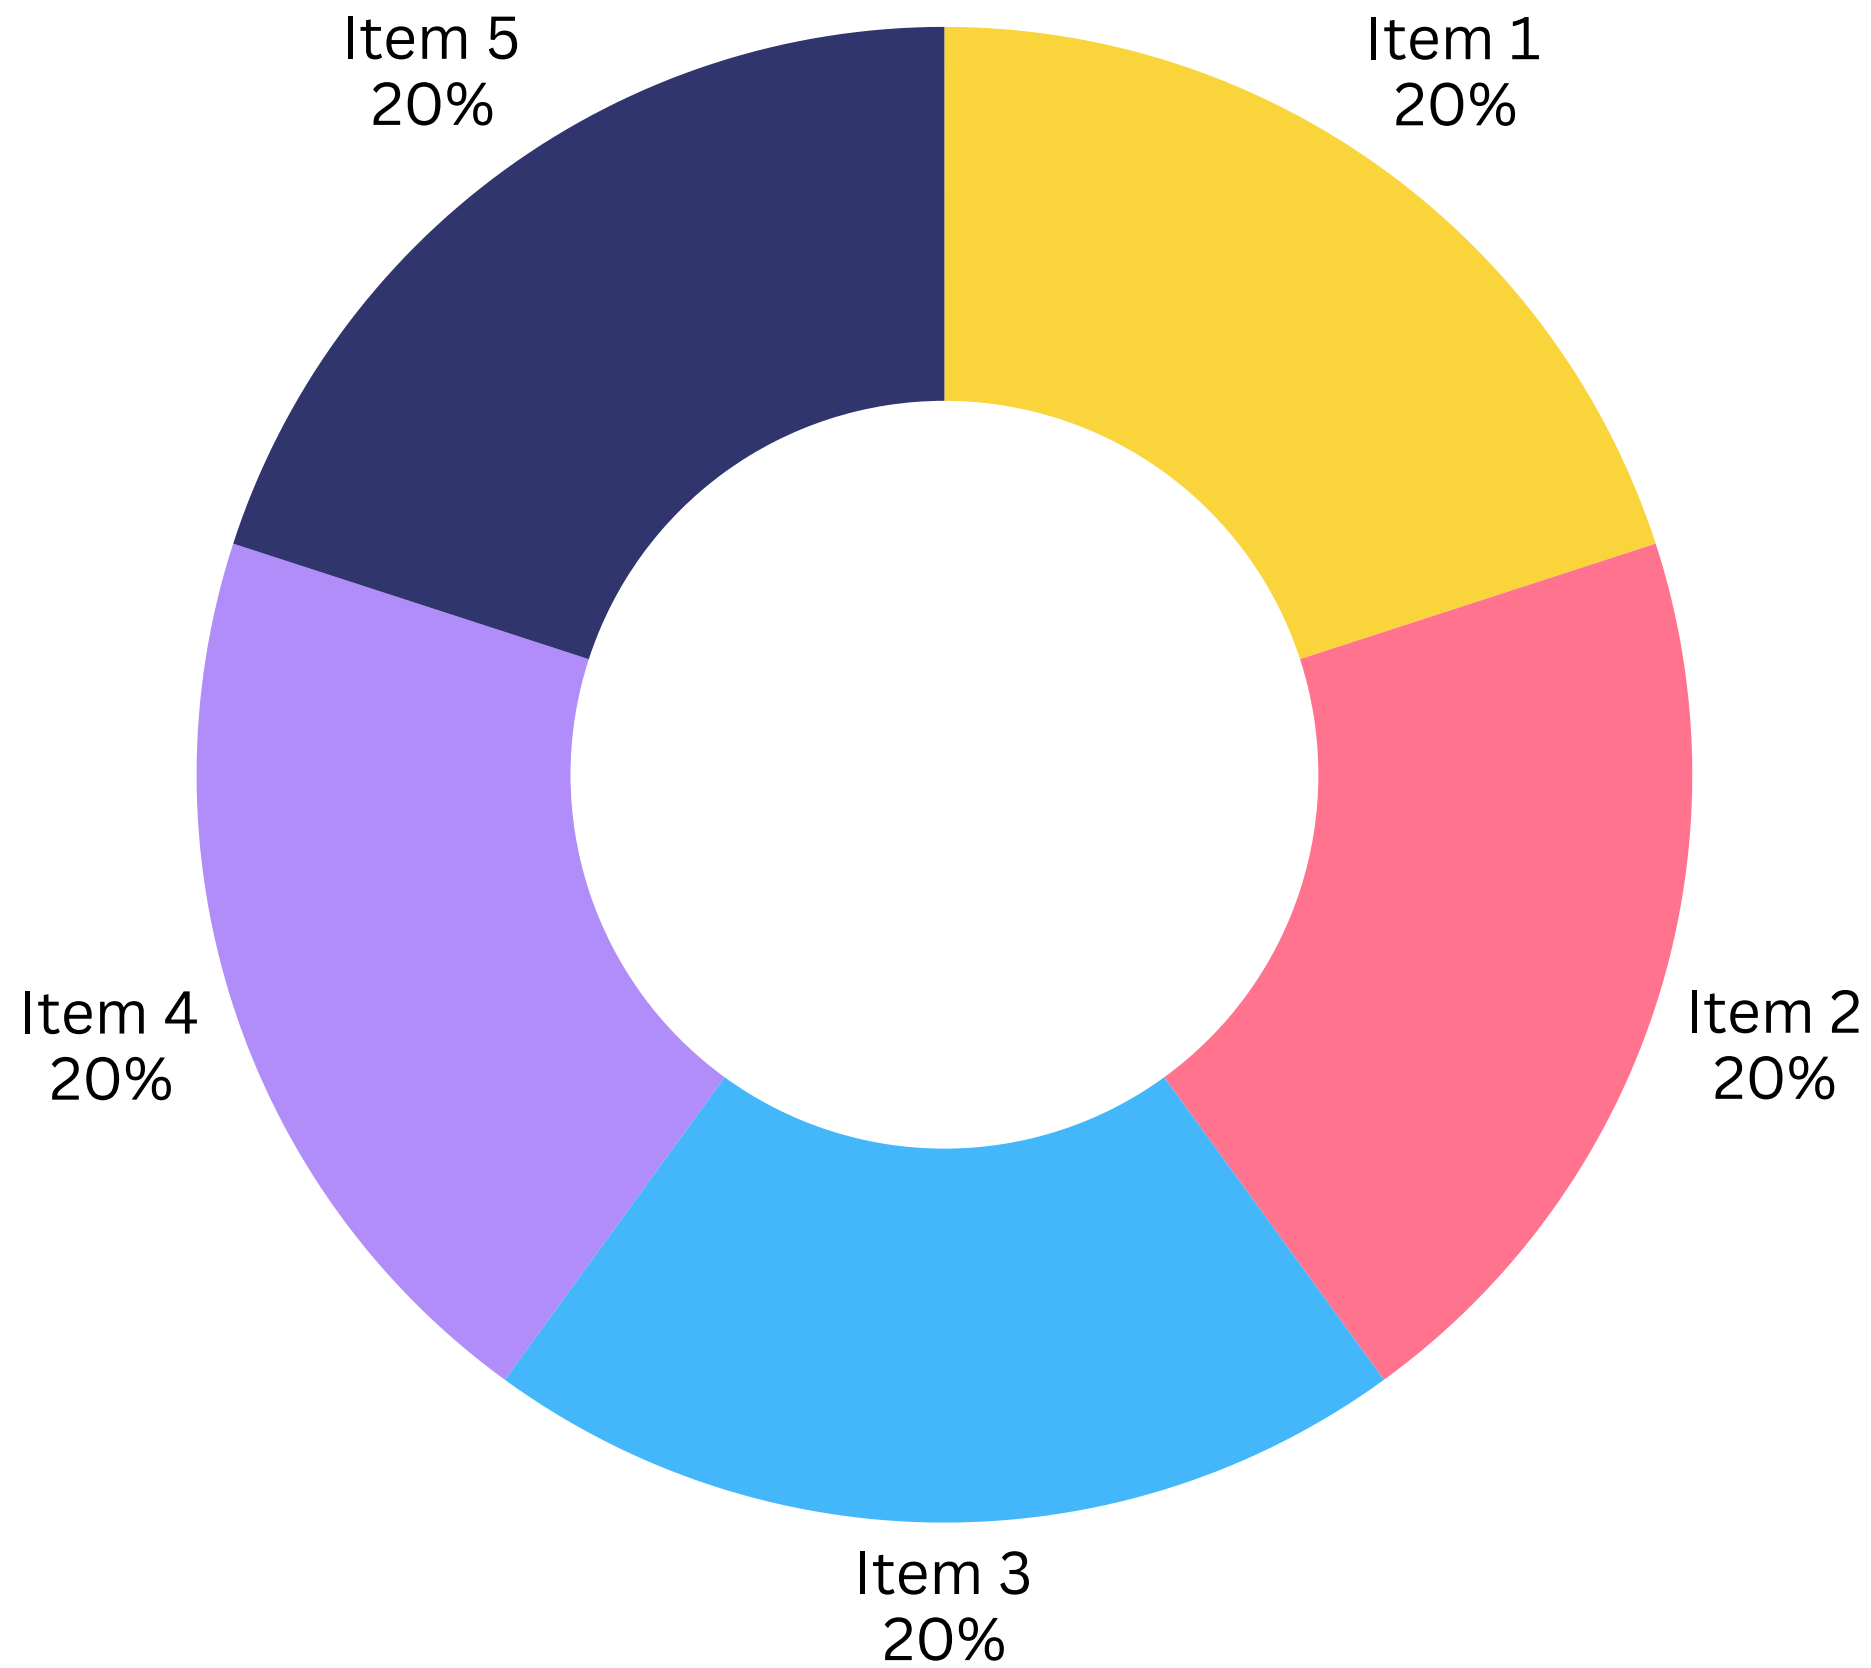

A stacked area chart is like stacking colourful blocks on top of each other. Each block represents a different part of something observed. When we stack them, we can see how the total changes over time.

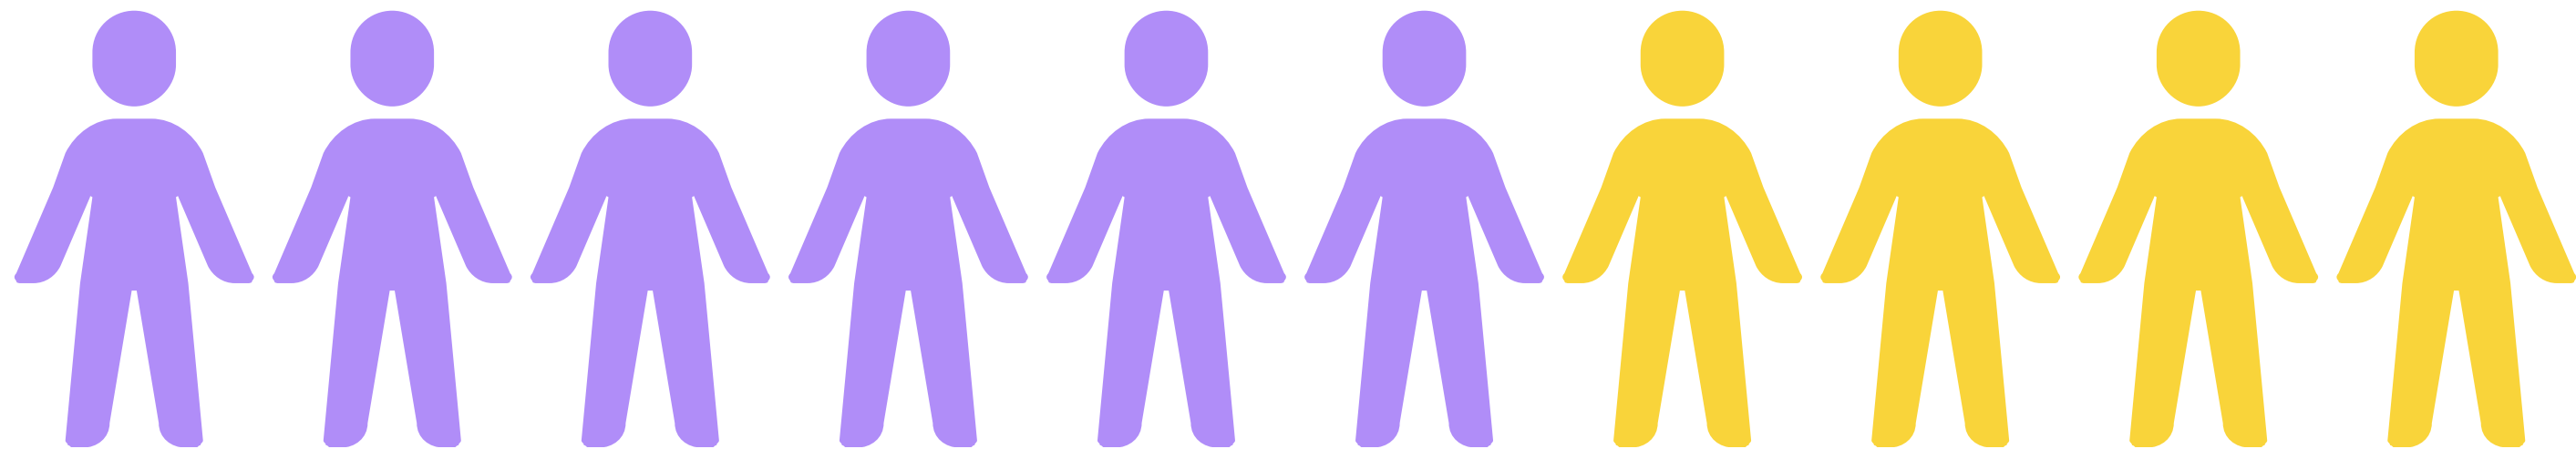

A pie chart is like a pie cut into slices. It helps us see how parts make up a whole. Pie charts are great for showing how things compare.

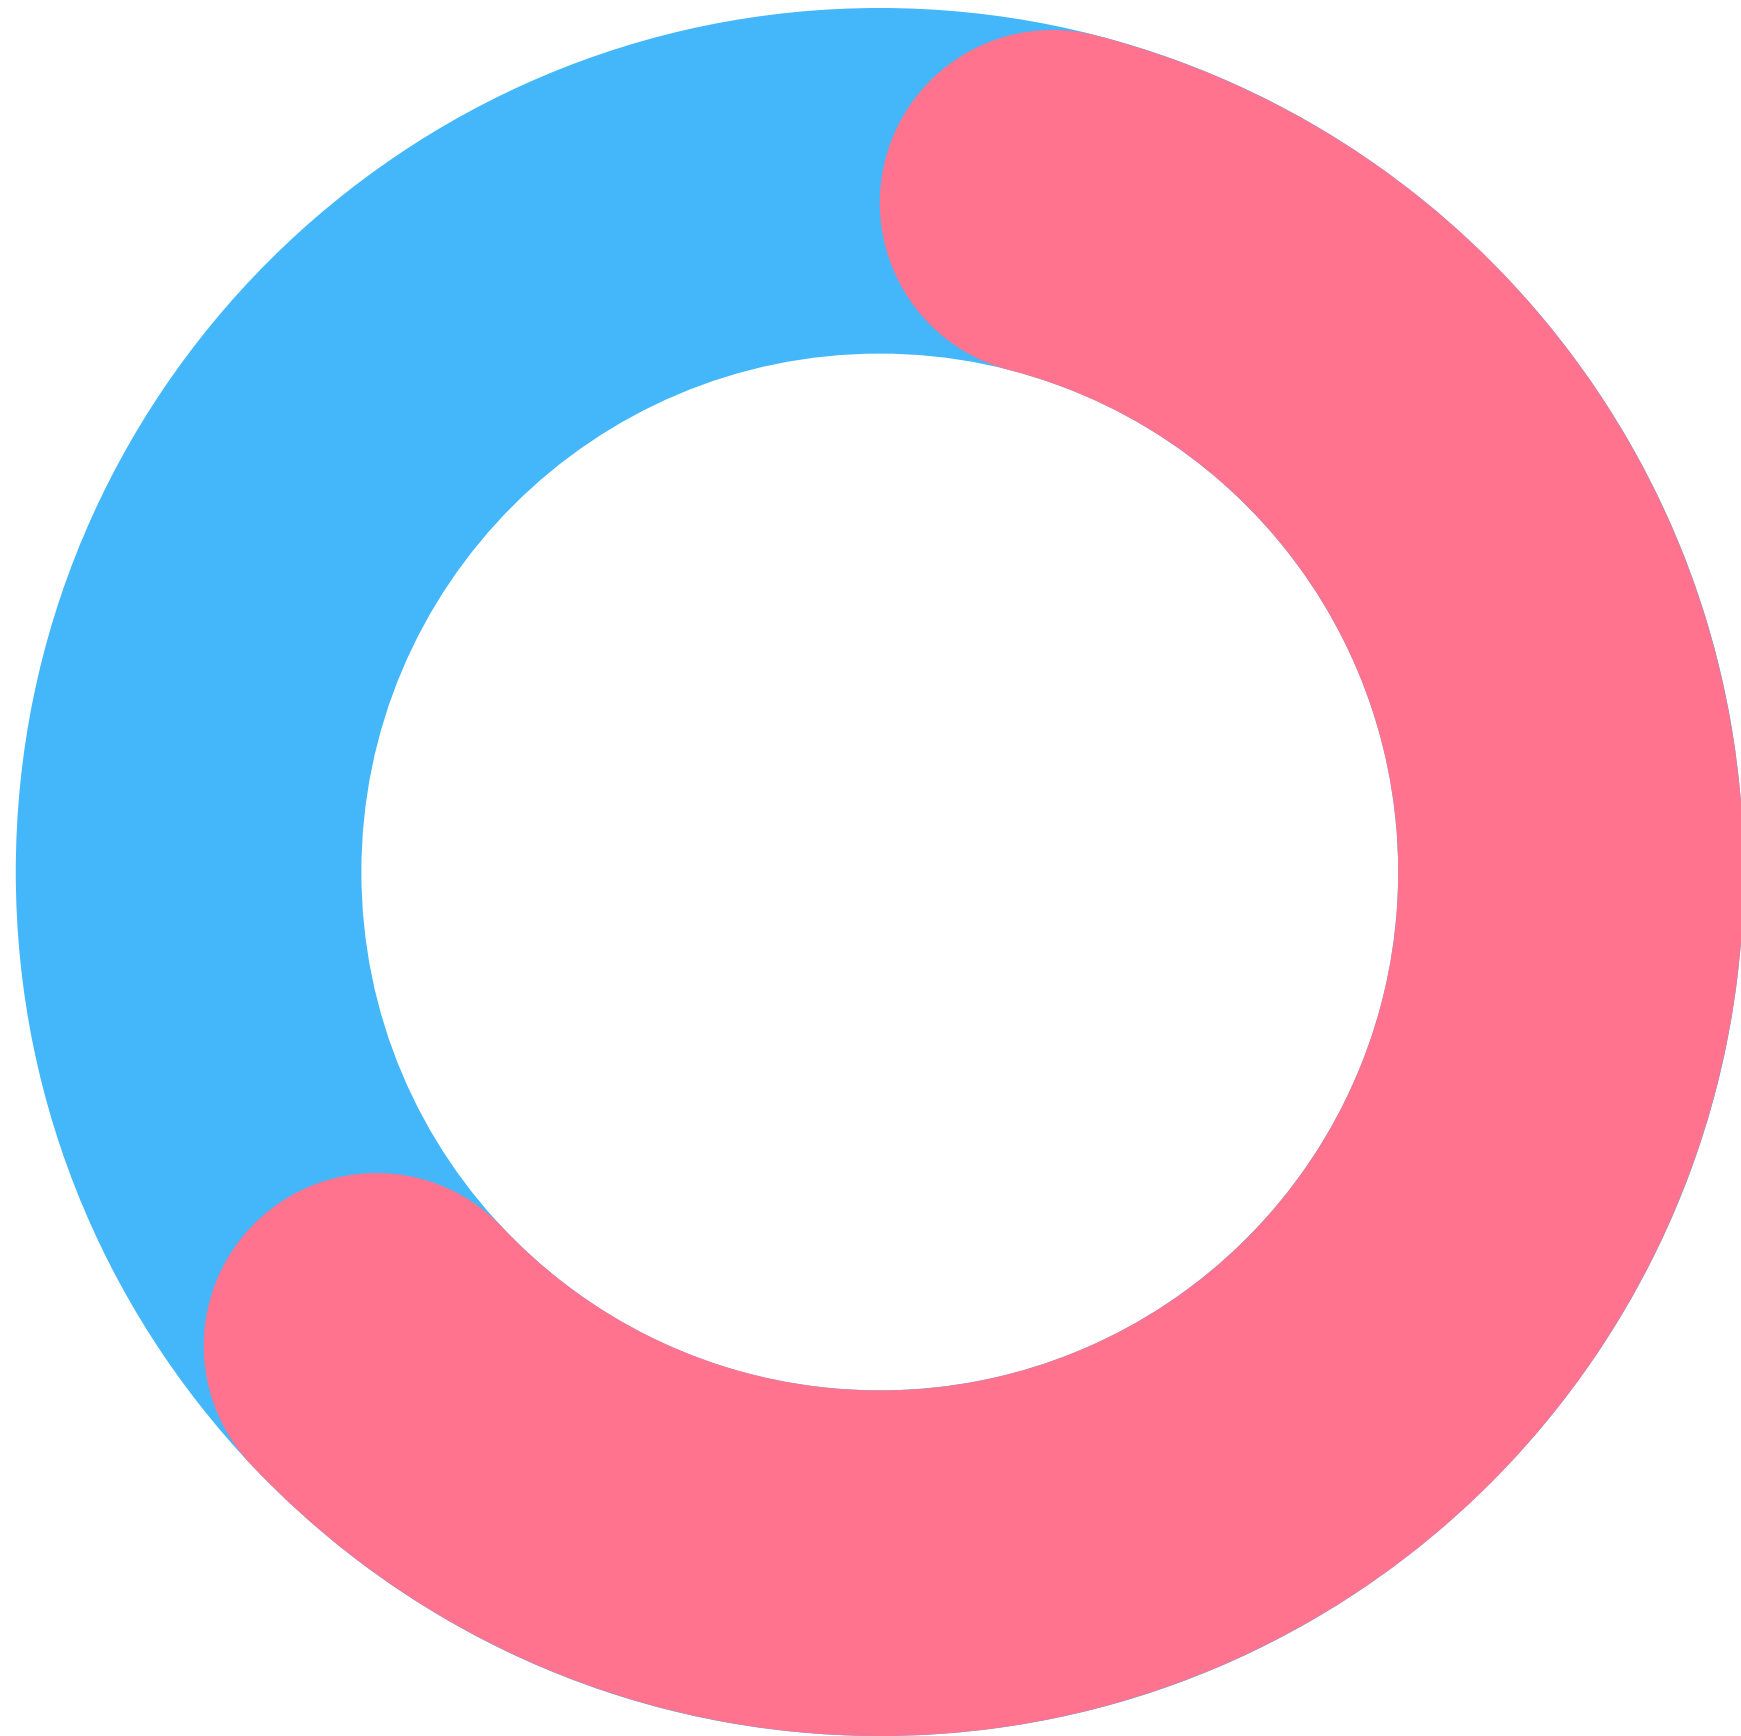

A donut chart is similar to a pie chart, but it has a hole in the middle. Each slice still represents a part of something. Just like with a pie, it helps us see how parts make up a whole. Donut charts are used to show how things compare, just like a pie chart.

A pictogram is a special chart that uses pictures or symbols to show information. Instead of numbers or words, it uses little drawings to represent things. Pictograms make it easy to understand information with pictures!

A progress ring is like a circle that tells us how far we've come or how much we've completed. It's a visual way to show progress.

THE END

Thanks for listening!
